

Express Bulletin N65

Scientific production

To Georgia and world scientists

Problem-theme: "Issues of improvement of the complete system of world management and level of production in terms of technical progress"

We publish the scientific paper of the Technics-Technology, Economics and Management Solutions Ltd, Scientific Center and the Director of the Fund, Intellectual Club President, and Academician Leri Chachibaia, published in Express Bulletin N62.

In the terms of technical progress to content increasing demand for forage and medicine necessity it is very significant to produce ecologically pure production by using a new technology, which serves to preserve, produce, recycle, reserve the existing elements of the raw materials without thermal recycling to the point of reservation, realization and usage in order to avoid 45% loss.

65% of existing elements in a plant extract is appropriate to the existing content of a human body, that gives a way to cure complex diseases such as tumor, herpes, hepatitis and other 39 variations of the complex diseases. Bringing microelements in it is a way to cure inflectional and fungus diseases in an intensively short time. It also can be kept in a room temperature for years.

In 1997 by using the new technology, natural tea was produce without pressing and thermal recycling. In such a way it is possible to preserve 80%-85% of the substantial elements of the plant. Insist on the demand it was set up in the whole world what about the demand is increasing annually. The plant extract has a great deal either for meal or in medical treatment which is used from 1993 in the group of plant extract. There is no any alternative way in reserving natural elements in the terms of ecology, economic, social and security. It is also very important to use treatment extracts in veterinary for animal treatment and to use eating extracts for feeding them in winter conditions. In natural drinking juice in the terms of treatment and nutrition, it is very significant to vindicate its content elements.

In the technical progress conditions producing plant-growing and cattle-breeding products and medicaments for treating without using energetic recourses is very considerable connected to the global problems' solving. It is supposed to be the main article to connect different branches, which does lead move on the right side, in the results of those new conceptual skills were formed.

1. Reduction of material and labor costs taking into consideration scientific research. 2. Rationalize use of natural resources and employing the workers. 3. Safe treatment of complex diseases with ecologically clean products, plant growing and livestock products of ecologically pure products complex complexes that positively affect human psychology in intensive timeframes (Production, processing, storage, sale, use, consideration). 4. Under the technical progress, it is more important to obtain ecologically clean products without thermal processing (without the use of energy resources). Today it is very important to eradicate global confrontation between society and the state, for this

purpose the problem will be solved by creating a system of world management. Where the consolidation of the society, the regional governance of the state, the protection of human rights, increasing intellectual creativity are crucial.

A new complex approach to the problem will significantly reduce the conflicts facing humanity, which are permanent. If international organizations get involved after the wars to solve the problems, why cannot it be solved with creating unified world management system. As we know war has not brought good for any formation. The world must come out of the existing problems and get strong decisions. Due to the current necessity of creating a unified management system, it is impermissible to pass on the power of parliament to the government, since they are competent to solve 80% of existing issues worldwide. Its place will be taken by centers and branches of public consolidation, regional governance, human rights protection, and regional intellectual creativity.

Problems have been positively reviewed in scientific institutions, ministries, in relevant committees of parliament, structures within political parties, government, UN and EU etc.

Publishing academy editorial board, the group of information supporters hopes that these issues will be the subject of discussion of the public and the science, which recommendations, conclusions should be sent to the author. Where I hope to involve the Facebook and E-mail of press and media.

Respectfully editorial board and initiative support group.

Chapter I

1. Implement of new technologies for efficient processing of food and medicinal products.

The actuality of the issue: the existence of human being promotes first and foremost the use of nutritional and effective medicines for maintaining life. For this purpose it is necessary to improve the production level by implementing the new technologies that rationally use the natural resources of the region to receive ecologically clean and competitive products with less material and scarce expenses. To maintain the maximum capacity of its composition – production, processing, storage and use of existing raw materials, to achieve the full reliability between the product and the human body, which is very difficult process. The solution is to look here.

Problems of solving problems. 1. To maintain the full structure of existing raw materials for the efficient use of food and medicines, new technologies need to be obtained from the plants roots, stems, leaves and fruit paste extracted from room to room for a year since 1993.

1. Tumor; 2. Herpes; 3. Hepatitis; 4. Goitre; 5. Psoriasis; 6. Cardiovascular system; 7. Digestive system; 8. Eczema of skin diseases, gangrene, neurodermatism; 9. The dryness of the mouth; 10. Feeling cold in the joints; 11. Atherosclerosis; 12. Undesirability; 13. Dysfunction; 14. Air failure; 15. Increase strength; 16. Adenoma; 17. Some diseases of tuberculosis; 18. Infectious and fungal disease; 19. The ear of the ear; 20. The shock of the cab; 21. To restore blood vessels; 22. Diabetes; 23. Worms; 24. Pressure; 25. Due to the disappearance of the black dots to improve vision; 26. For painkillers; 27. Swelling; 28. Boon; 29. Metabolism; 30. For the treatment of genital disease; 31. Warrior; 32. To clean the poison from the digestive system. 33. Restores muscles, rejuvenation. 34. Deteriorates the inflammatory process of funds. 35.

Helps restore bone tissue, promote calcium balance in bone tissue. 36. Treatment of inflammatory process in grips. 37. Toothbrush recovery. 38. Treatment of Stress. 39. Removal of Dialysis.

It should be noted that 60-65% of the composition of these extracts coincides with the composition of human organism that positively affect the treatment of the above mentioned diseases in the extract of fish, poultry, pork, beef, sheep and meat for a long time in room conditions. It is very important for nonalcoholic drinks in the production of nonalcoholic beverages from citrus fruits, potatoes and vegetables, berries and biscuits from extract and extract from 1993.

Nonalcoholic beverages are kept in room for 12 months.

It is great for the use of cattle breeding in the field of treatment and food as well as for the use of other farming areas. The use of such technology also uses sea algae for feeding and treatment. Because the novelties in the work are the issues of global importance, it is difficult to present the performance of the ecosystem efficiency with the consideration of different factors which exceed hundreds of billions. This is also about issues related to perfection of management.

There was a case when the patient received four to five times the norm, but it was not negatively negative. During the first two courses of the cancer treatment, the patient has severe pain, reaction and psoriasis treatment 20% increases the number of exfoliation in the initial process.

According to the psychological norms, 7,3 billion of the world population will be satisfied with food grains 7×10^{15} kg of calories every year. For this purpose, we need 569×10^9 kg calories, milk 1×10^{15} kg calories, eggs 2×10^{12} kg calories, potatoes 708×10^9 kg calories, 131×10^9 kg calories, vegetable oil 51×10^9 kg calories, bread products 883×10^9 kg calories, and parsley, vegetables 1×10^{12} kg calories, sugar 131×10^9 kg calories. For this purpose, the level of production is needed to increase 35%, which is very difficult process. The crucial importance here is the introduction of new technologies in the field of agriculture and industry.

2. Occasionally, as a result of the treatment of trauma, iron can ne be removed from the patient's body for years, which negatively affects his health. This issues concerns the use of intensive medications in the treatment of trauma, where there is no iron for the entire organism and individual bodies for treatment. Using any of these extracts as a hand cream, can be used in any place where the patient can be taken.

3. Alcohol drinks are important for new alcohol making technologies, where all types of raw materials are used as energy sources. Minimum loss of alcohol during processing is to support the development of farming economies with 35% of the economic effect of 1-liter alcohol. It is a positive assessment of the use of food extracts in beer production, as well as various dry drinks that do not have any alternative in the perspective. With annual state-of-the-art 300 million tonnes of raw materials, energy sources transported to the industrial area. With the new technology of alcohol consumptions.

4. The new technology for making sour cream and cheese are adopted by one sorted system in room temperature for 11 months. Milk does not need milk for 12 days to keep boiled for 12 days without refrigerator. Acceptable aroma products that are positive for digestive and nervous system and others. Sprinkling of aromatic cheese and sulgunade is stored in the room for 4 months, which can be used for bread in exchange for yeast. The effectiveness of refrigerator equipment,

industrial space, energy resources, even if 35% reduces the cost of the economy in terms of cost savings worldwide, including other factors.

5. The new technology received as a result of naturally drying the tea considers tearing, fermentation and artificial intake, resulting in the aromatic resin of blackish color that is not characteristic for any type of tea. Estradic substance is 48%, and tannin is 9%. It is important to use medical extracts for the treatment of psoriasis, eczema, cardiovascular and nervous system, etc. It is very important to get tea and medication without thermal processing, stored in room conditions for 11 months. These technologies have been used since 1997.

6. The new technology of grinding – where the gas is not covered by the gas zone, all kind of energy resources used for fuel are mostly clay. We get hot water. It is made on five floors floating on a floor with a complex mechanism. It is very important to take care of the meat and cheese in the canning process. The structure is moving. The economic effect is more than 244 million annually (according to 59 countries). It is important to note that the introduction of the new technology of medicinal bread that is very important is 6 species of granular and leguminous plants with high aroma and long lasting maintenance (2-3 days) without yeast.

7. Specialized, semi-trailers and wagon containers carrying cattle and wild beads with all types of vehicles, whose trial samples are recommended to be introduced in the Traceka project where cattle are transported by three to four floors. Approximately 26% of cattle total rail transport, and 44% of car transport. It is very important to transport livestock by means of transport for winter and summer pastures, as well as to keep weight in meat products. The semi-trailer variant of 60% increases by placing 98 cm floors between the wheel and the third floating floors. Parameters: 11x4, 5x2,5 meters, allocated for all three floors, nutrition, metabolism. As well as economic efficiency in the carriage of carriage in both types of transport, fuel, electrical energy, stock loading and loading operations.

8. In the production of alcoholic and nonalcoholic beverages, the food and medicinal extract has long been stored in a barrel container in which the bottom and side of the page is made of red clay – the upper side of the ceramics is used for the disinfection of microelements. The structure is moving. Container keeps fit and economic efficiency is determined by indicators of storage of raw turnover, etc. which is 500-700 liters, 25% of the respective raw materials value.

9. Planning the New Library from the repository to the reader the book is delivered by complex mechanization – automation, in terms of infrastructure, it is crucial to improve management, which is positively reflected on the quality of intellectual creativity. With a minimum calculation of 45 personnel, the economic effect is 7.2 million dollars per year in comparison with the construction of a single item and other material costs, resulting in better management of sanitary hygiene norms in the repository.

Chapter II

1. Improvements to the world unified management system

The management of the world is more or less carried out by the UN, EU and CIS countries, which indicate that there is a necessity to manage the world in a centralized way to minimize the conflicts between countries, which negatively affect the development of humanity.

Technology advances, it is prohibited for a violent religion of humanity management, consolidation of society intelligence and other factors in the country, this issue is of great importance to the management of the system , to minimize conflicts between states.

The implementation of these issues will eradicate global confrontation between states, which is a substitute factor. Confrontation can no longer be considered as a means of peace. The issue should be determined only by means of proper management. It is unacceptable to make a decision alone.

For this purpose it is necessary to create a unified constitution of the world to be elected president, chairperson of parliament, and a member of the respective states. The center and the States must create controlling body in the society that will control the entire management system of the country, with the Public Defender and Human Rights Structure. The controlling body will be created by units represented on the basis of peripheral organs.

The above mentioned structure should be able to present candidates recommended by them for two or three days prior to holding the elections, so as to limit its influence to the electoral company, conducting such elections will contribute minimally to the controversy between the subjects . Realization of the above-mentioned issues will facilitate.

1. The structure of the Uniform Defense and Law Enforcement Agencies shall be formed.
2. Centralized management will facilitate the global development of the field of public sector rational use of natural resources workers between the continents and so on.
3. Creating a unified scientific potential facilitates rational use of the natural resources of the planet.
4. The point is to apply the environmental and territories that are permanent for years.
5. The creation of a single currency system will contribute to the development of trade culture and other spheres among individual continents.
6. The global confrontation between states will be reduced to a minimum, which is very dangerous for taking into consideration socio-material issues.
7. It is important to establish a common belief in the face of mankind. To strengthen pace in the world, which considered to be a problem for all formats.
8. Since there is no uniform system of governance in the states there is no obligation to meet the obligations in each of the states which negatively affect the global problems in the world. It is unfulfilled about the issues that are to be addressed to humanity, which is a permanent character every year.
9. Establishment of a Unified World Management System Deputies within the Parliament are better protected the representation of all states in the interests of religion, tradition, territory, and other views.
10. Minimize to minority the influence of large states on other issues Management system existing is smallest states do not have an obligatory requirement of performance mechanisms for anybody in the nature of the recommendation.

11. By enacting a uniform constitution, self-consciousness and responsibility of individual governing politicians will be increased to protect their interests other's interests.

12. Impairment of individual individuals will be reduced to minimize the development of personal interests in the management of small states.

Participation of lawyers, economists, military specialists and scientists is necessary in order to develop a view of common opinion to solve a more complex issue. Conclusions, guidelines, recommendations please send us. In other words, I hope scientists will be able to understand the problem of solving the current problem that has long been that all the planet's inhabitants are able to dispose of their own future of faith, for which he has appeared in the world – to perform his duties. Even if all states take the initiative for 4 days to put an end to violence –the war that has been achieved for all years! It is inadmissible to pursue personal goals against the interests of others because both sides have come to this country in one form.

2. Unifying Financial and Economic offices together

In conditions of technical progression, it is important to create united management system to avoid controversy between society, state and different countries. Today's managerial forms cannot deal with domestic and foreign issues properly, which often causes controversy between society, state and different countries. This happens because society chooses legislative and executive organs, who should be responsible to society consolidating organ – council (that should consist of political parties, youngsters, religion representatives, veterans and etc.)

To solve problems State is facing, any party, association in accordance with competition principles, should have ability to take State governing body officer position – in executive organs instead of deputy, for certain time and with relevant remuneration. Executive structure of government will replace all Parliament organs; executive and consolidating organs will be created – public defendant, prof unions, electoral system, State governing scientific academy, all this will be unifying into single block, they will realize society's every demands. Based on State constant principles, governing should be based on society's interests and not individual point views. Because of this main objective is consolidation of society.

Above mentioned governing system will ease economic, social and legislative relations between State and society. This will give us opportunity to establish united governing system of world. I should mention the importance of accordance between specialties and concentration. Most of all this affects economic relations as a form of connections between states. In that case, we need to unite economic and financial ministries. In conditions of technical progress using natural resources, using work force rationally, raising specialization and concentration levels in order to satisfy growing needs of population and to achieve that we need to cut off material and industrial expanses. Cooperation of industrial fields will promote unified governing system that should govern from center towards the peripheries and vice versa. Every ministry should concentrate on using natural resources, development of regions, satisfying industrial cities with food and industrial production etc. Every state organ, executive, legislative etc., should be controlled by monitoring bureau. Analyze-prognosis of natural resources used, utilized, realized etc. Every analyzing and governing centers of every ministry should be managed by scientific academy; management should be based on 10-15 years of past results. Economic and financial services should be united.

1. Analyzing and prognosis scientific center.
2. Planning department in ministries.
3. Education, science and innovation ministry.
4. Department controlling using natural and work force resources.
5. Privatization and business department.
6. Income and control department.
7. Financial and budget department.
8. Department for relationship with foreign countries, trade and tourism.
9. Department for administrative issues.
10. Department for legal issues.
11. Audit department.
12. Department for industrial work.
13. Department that communicates with administrative organs, public and press.
14. Emergency management department.

Existing services in ministries should merged with relevant departments. Head of economical department should be economist and his deputy financier, and vice versa in financial department. Minister / economist should be chosen inside ministry. Analyzing and prognosis center will be responsible for quality work of ministries. This center should be staffed with qualified professionals, who should monitor every other department.

Society chooses executive structure of the government, who should govern public industries, who therefor perform 80 % of work. Ratio should be the same in structures between states. Such form of public consolidating and executive organs is enough to govern a State. Public consolidating organs should consist of political parties, who will participate in rebuilding of the country and will be paid according to their intellectual portion; he will be presented to executive organ and will be appointed as a representative and not a deputy. This means that political parties will be used as a mean to form executive structure (using consolidating organ).

In such situation, president's role is to balance the power between central and peripheral organs to create unite governing system. Not to let governing system being divided into autonomies. Ministries should choose their ministers and prime minister should be chosen by ministers or consolidating organ. In this concept, it is impossible to form united governing system without consolidated society, which should lead to unite governing system of the world, this puts up a need for a united legislative base, in its social, religious, racial issues, taking into account public (regional) interests, should be resolved. If there is a will to form a united governing system than it should be created, that would minimize the controversy between public and government. Because of its difficulty, above mentioned issues should be implemented step by step.

3. Issues of investigative and judicial improvement

Under all formalities, human rights should be protected, in order to protect human rights in accordance with law, is necessary to establish a system of existing investigative and judicial structure. In this case, any offense will be more

efficient in one structure rather than separately, resulting in a substantial reduction of material and livelihood costs. All offenses subject to the separation of civil, criminal, and administrative cases require the acquisition, processing, and review of various evidence, which is a very difficult process. To this end, it is necessary to unite the judicial and judicial system. The investigative structure should be able to conduct itself in accordance with investigation and give legal assessment as a through ruling. If it is necessary to appeal the decision by the Party, he will appeal to the Appeal and Supreme Court. And review will be considered as the first instance court. Establishment of the Uniform Structure of the Investigation Court facilitates the acquisition of evidence on an issue, in order to minimize the interference of different persons, the impact will be limited to one body.

It is necessary to divide civil cases according to complexity. Simple cases can be judged by administrative procedures, and relatively difficult issues to be given to the court, where a legislative base should be established to minimize the cost of material and time, the responsibility to take all the responses to the first instance. The part should not be required to obtain, examination, etc. In this case, all the burden of moving to the first instance court and investigative structure, thus easing the second and third instances, which resulted in a significant increase the degree of competition, which will facilitate the introduction of a comprehensive management system, which is no alternative to the social, material issues for. Now all the investigative units is one system will facilitate scientific research, forensics, the new unified bloc, which is to be subjected to the prosecutor's office and Parliament, in accordance with the regulations of district, regional and central departments must be selected since 6 term community.

4. Issues of State management improvement

Formation of any necessary consolidation of the society and not confrontation, when the government chooses the organizational systems, to avoid endless disputes, which adversely affects the ongoing processes, conflict management systems largely, specifies the relevant indications.

It is necessary to consolidate the society where political parties, war veterans, youth, non-governmental organizations, religious representatives and others will join. Their representation should be determined by 50% of the elective bodies.

Executive, legislative, and general public performance will help to improve management. The system of driving the state will not be without society, society will not be without economy, management, religion, and so on. To establish a unified management system in the regional context – Autonomy It should be studied into individual elements as the elements as the region's priorities, consolidation of society will contribute to the competition between political parties. The public Defender shall be in accordance with the regional, regional and central authorities elected by the public. He should be able to protect the rights of his/her citizens in any country. It would be good if we discuss with the press and media, together with the trade unions, to create a unified public system that is oriented towards public interest.

The consolidation point is that' the person chooses a decent place in accordance with its values. Creation of the united "background" of the society will help us to choose the footsteps in advance according to their creativity. Today's electoral system fail to respond to state management requirements, resulting in a confrontation between political parties

and the public. Which negatively affect the country's rebuilding. The motivation that the MP and the officer cannot answer today's demands is in the head. Consolidation of forces, state management must be carried out from periphery to the center and not vice versa. It is necessary to create a higher education graduate academy of state management. The solution is to look for intellectual creativity. Disciplining management systems as a result of the negative impact of the country's rebuilding. This academy will be trained to prepare the public official with the priorities of the country. They should be presented by the district administration until the creation of a publicly-consolidated body. In accordance with the submission of the regional population, after the passing examination, the "learner" will be elected after the graduation, in the same district or in the organizational issue which will be accountable to the public consolidating body. Formation of the issue is such a form will facilitate the preparation of permanent equilibrium staff, which will be oriented on the development of the country.

-According to all districts , for the formation of the parliament , there will be enough 200-250 MPs (is civil servants) for the five million inhabitants , resulting in the parliamentary and governmental "foundation" – If the candidate for the Deputation receives more than 50 percent of the votes, he should be elected as a majority by the principle of majority.

-If the MP candidates receive less than 50 per cent of the votes, the elections must be either in the majority of votes or by the majority vote;

-The candidate should be elected on the position of the Chairman of the Parliament in case it receives more than 50% of the voters.

-Candidates who will not receive 50% of votes will be elected to the Parliamentary Chairperson's office by the Parliamentary majority principle;

-If the voter votes more than 50 percent of the vote for the presidential position, the candidate shall be elected as the president of the majority of votes;

-The selection of candidates who will not receive 50% of votes will be elected by the Parliament by majority vote.

-If the voter votes more than 50% of the vote for the presidential position, the candidate shall be the president of the majority of the votes.

-Choose candidates that cannot get 50% of votes to be elected by the parliament by voting by majority vote. In order to increase the quality of the president, parliament speaker, prime minister, the 50-member parliament, or government fund, to receive the "elite", must take 50%. From 125 people are selected 63, who will be elected three candidates – President, Parliament speaker and Prime minister. In the event of their intervention, they will be held on the basis of the lottery.

It is more important to introduce a new ballot paper form, where the name of the parliamentarian and the presidential candidate is nominated. The ballot will have both sides (identical numbers) Name, surname, residence and position indicators of the mentioned voter. When choosing a candidate, the voter will leave the left part of the ballot. In case of dispute, he will tie up his number with whom he voted.

“difference approach” require the choice of the prime minister. According to its specificity and complexity , the issue of governance is largely dependent on it. The Prime minister should be elected by the Ministers as well as their first Deputies. In the choice of the president’s administration is given 15 votes, Parliament speaker and the chairmen of the committee according to the conformity. Parliament and the President’s administration are allowed to nominate a candidate for prime minister in exceptional cases.

Political parties, public organizations, individuals are not allowed to participate in the elections. The election itself is the choice of selection. It is not permissible to set limits on it. In the conditions of holding elections objectively, the truth must prevail. Everything should be aimed at achieving as much as possible the district governor, mayor, minister, can choose the same system etc.

The term of the election should be determined for 5-6 years, or which a great deal of time is spent on establishing the structure of governance. The presidential and parliamentary self-governance elections are required to improve organizational issues one day and it will be declared an important day. The MP who does not fulfill his promises shall be provided within nine months in accordance with the voting majority by the voting majority. The change of the existing electoral system will eliminate many barriers, reduce the aim of confrontation and belief in the society that the rule of law will bring the social-material goodness to the faith, which will be unchanged by the law.

No confrontation The hunger strike will be considered for the first time as a starting point for its form-content related to the spiritual social issues of the human being. In this case the preference should be given to a referendum 51% of the population should be responsible for the performance of the executive structure (administration) after the failure of the three days after the demonstrations , the party is obliged to reimburse the other party to avoid any unforeseen consequences. Every four years under the conditions of 4million voters in the presidential parliamentary and self-governing elections, if spent 108 million GEL or 45.2 million dollars will be spent of billions of dollars 7.3 billion world population, with 5,2 billion voters. The expenses incurred as a result of he confrontation are not included in the amounts. It should also be taken into consideration economic indicators that resulted from improvement of election term and quality , which in total overall sums up to a billion in the minimum calculation. Today, the amount of money spent on elections and war in the world is bout % of the amount that will be reduced to 50% by intellectual creativity.

To hold a meeting in connection with the need to impose a fine for material and moral damages caused to engage the responsibility of the party whose incorrect activities led to a rally in the total amount of the winning party to be deposited 70% of the budget venue was 30% of the legislation extended to the election of the wrong action of the Ex The party criminal acts, which occurred as a result of the second election fraud, etc.

5. Program requirements for candidates to take position in elective bodies

To take the position candidate should present program accepted by society 4 months before the elections. According to reviews by political parties, scientists, State officers, religion representatives, veterans etc.

Candidate for Presidency, Prime Minister, Minister, City Mayor, Deputy and an alternate Candidate is obliged to present the main staff of those persons with whom he/she has to work with.

Society should be informed about fulfillment of the obligations in every 8-9 months. If the obligations are not fulfilled, electorate has right to recall him. Candidate should pay attention to:

1. Main fields for improving the State, considering the perspective.
2. The main priorities of the country's economic development, Proper arrangement of the fields, perfection of specialization-concentration. Utilization of natural resources in accordance with the requirements of scientific-technical progress and consideration of workers' employment.
3. Defining the main factors determining the domestic and foreign policy of the country.
4. Strengthen the defense capabilities of the country and secure the legal base and active engagement of the community.
5. Cooperation of scientific potential of the country, education and science, intellectual creativity of youth in politics, business, religion etc.
6. Solving Social Problems.
7. Considering the region's exploitation of natural resources and solving ecological problems.
8. The candidate should give the above and other issues a complete reliability in the political, economic and social context, at the scientific level, in view of the prospect of solving existing problems.

I hope the creative approach will facilitate the proper management of the state system in order to eradicate confrontations that are permanent.

Conclusion: In the terms of technical progress to content increasing demand for forage and medicine necessity it is very significant to produce ecologically pure production by using a new technology, which serves to preserve, produce, recycle, reserve the existing elements of the raw materials without thermal recycling to the point of reservation, realization and usage in order to avoid 45% loss.

65% of existing elements in a plant extract is appropriate to the existing content of a human body, that gives a way to cure complex diseases such as tumor, herpes, hepatitis and other 39 variations of the complex diseases. Bringing microelements in it is a way to cure inflectional and fungus diseases in an intensively short time. It also can be kept in a room temperature for years.

In 1997 by using the new technology, natural tea was produce without pressing and thermal recycling. In such a way it is possible to preserve 80%-85% of the substantial elements of the plant. Insist on the demand it was set up in the whole world what about the demand is increasing annually. The plant extract has a great deal either for meal or in medical treatment which is used from 1993 in the group of plant extract. There is no any alternative way in reserving natural elements in the terms of ecology, economic, social and security. It is also very important to use treatment extracts in veterinary for animal treatment and to use eating extracts for feeding them in winter conditions. In natural drinking juice in the terms of treatment and nutrition, it is very significant to vindicate its content elements.

In the technical progress conditions producing plant-growing and cattle-breeding products and medicaments for treating without using energetic recourses is very considerable connected to the global problems' solving. It is supposed to be the main article to connect different branches, which does lead move on the right side, in the results of those new conceptual skills were formed.

1. Reduction of material and labor costs taking into consideration scientific research. 2. Rationalize use of natural resources and employing the workers. 3. Safe treatment of complex diseases with ecologically clean products, plant growing and livestock products of ecologically pure products complex complexes that positively affect human psychology in intensive timeframes (Production, processing, storage, sale, use, consideration). 4. Under the technical progress, it is more important to obtain ecologically clean products without thermal processing (without the use of energy resources).

Today it is very important to eradicate global confrontation between society and the state, for this purpose the problem will be solved by creating a system of world management. Where the consolidation of the society, the regional governance of the state, the protection of human rights, increasing intellectual creativity are crucial. A new complex approach to the problem will significantly reduce the conflicts facing humanity, which are permanent. If international organizations get involved after the wars to solve the problems, why cannot it be solved with creating unified world management system. As we know war has not brought good for any formation. The world must come out of the existing problems and get strong decisions. Due to the current necessity of creating a unified management system, it is impermissible to pass on the power of parliament to the government, since they are competent to solve 80% of existing issues worldwide. Its place will be taken by centers and branches of public consolidation, regional governance, human rights protection, and regional intellectual creativity.

27 inventions, 3 discoveries, reviewed scientific research Institutes, Universities, the Academy of Sciences, Ministries, the relevant parliamentary committees, which resulted in Georgia's government 3.05.17 on N13 824 a letter of recommendation to the introduction of the foreign specialists, given the author himself made 5 test piece mastered 12 technology violet introducing methods that protected him in the patent and intellectual human rights law is not allowed to use it without a contract, as well as monographs and scientific papers. (Some issues are not subject to publication at this stage) It is very important that young people engage in regional, scientific and intellectual clubs and other issues to address independent issues.

Director of Scientific Center for Introduction of Techniques, Technology, Economy Management Problems Ltd.,
President of Intellectual's club.

Best regards,
